

# PostgreSQL Pitfalls

*Jeff Davis,  
Truviso, Inc.*

# What's a “Pitfall”?

- Unintuitive
- Frequently misused or misunderstood
- Not necessarily “wrong”
- Might even be required by SQL standard

# NOT IN (...)

- `SELECT * FROM foo WHERE x NOT IN (SELECT y FROM bar);`
- Works great during testing.

# NOT IN (...) Pitfall

- `SELECT * FROM foo WHERE x NOT IN (SELECT y FROM bar);`
- Works great during testing.
- As soon as you put a NULL into “bar”, query never returns any results at all!
  - IN uses SQL 3-valued logic
  - Predicate evaluates to FALSE or NULL

# Interval Math

- Add/subtract interval from timestamp
  - `SELECT * FROM order WHERE ts > (now() - '1 day'::interval);`
- Multiply interval by a scalar
  - `SELECT x * '1 second'::interval + now() FROM foo;`
- Wow, that's easy!

# Interval Math Pitfall 1

Additive inverse doesn't work:

```
SELECT
    '2009-03-31'::timestamp
  - '1 month'::interval
  + '1 month'::interval
<> '2009-03-31'::timestamp
```

# Interval Math Pitfall 2

- Commutativity is lost:

```
select '2009-02-28'::timestamp +  
       '1 month'::interval +  
       '1 day'::interval
```

<>

```
'2009-02-28'::timestamp +  
'1 day'::interval +  
'1 month'::interval;
```

# Interval Math Pitfall 3

- Scalar multiplication is not the same as repeated addition:

```
select
  '2009-01-31'::timestamp +
  '2 month'::interval
<>
  '2009-01-31'::timestamp +
  '1 month'::interval +
  '1 month'::interval;
```

# UNIQUE

```
CREATE TABLE t(i INT UNIQUE);  
INSERT INTO t VALUES(1);  
INSERT INTO t VALUES(2);  
INSERT INTO t VALUES(3);
```

# UNIQUE Pitfall

```
UPDATE t SET i = i + 1;
```

- **ERROR!**
  - Finds duplicate key and raises error before command is finished.

# UNIQUE Pitfall (cont.)

# Snapshots

```
CREATE TABLE foo(b BOOLEAN);  
INSERT INTO foo VALUES(TRUE);  
INSERT INTO foo VALUES(FALSE);
```

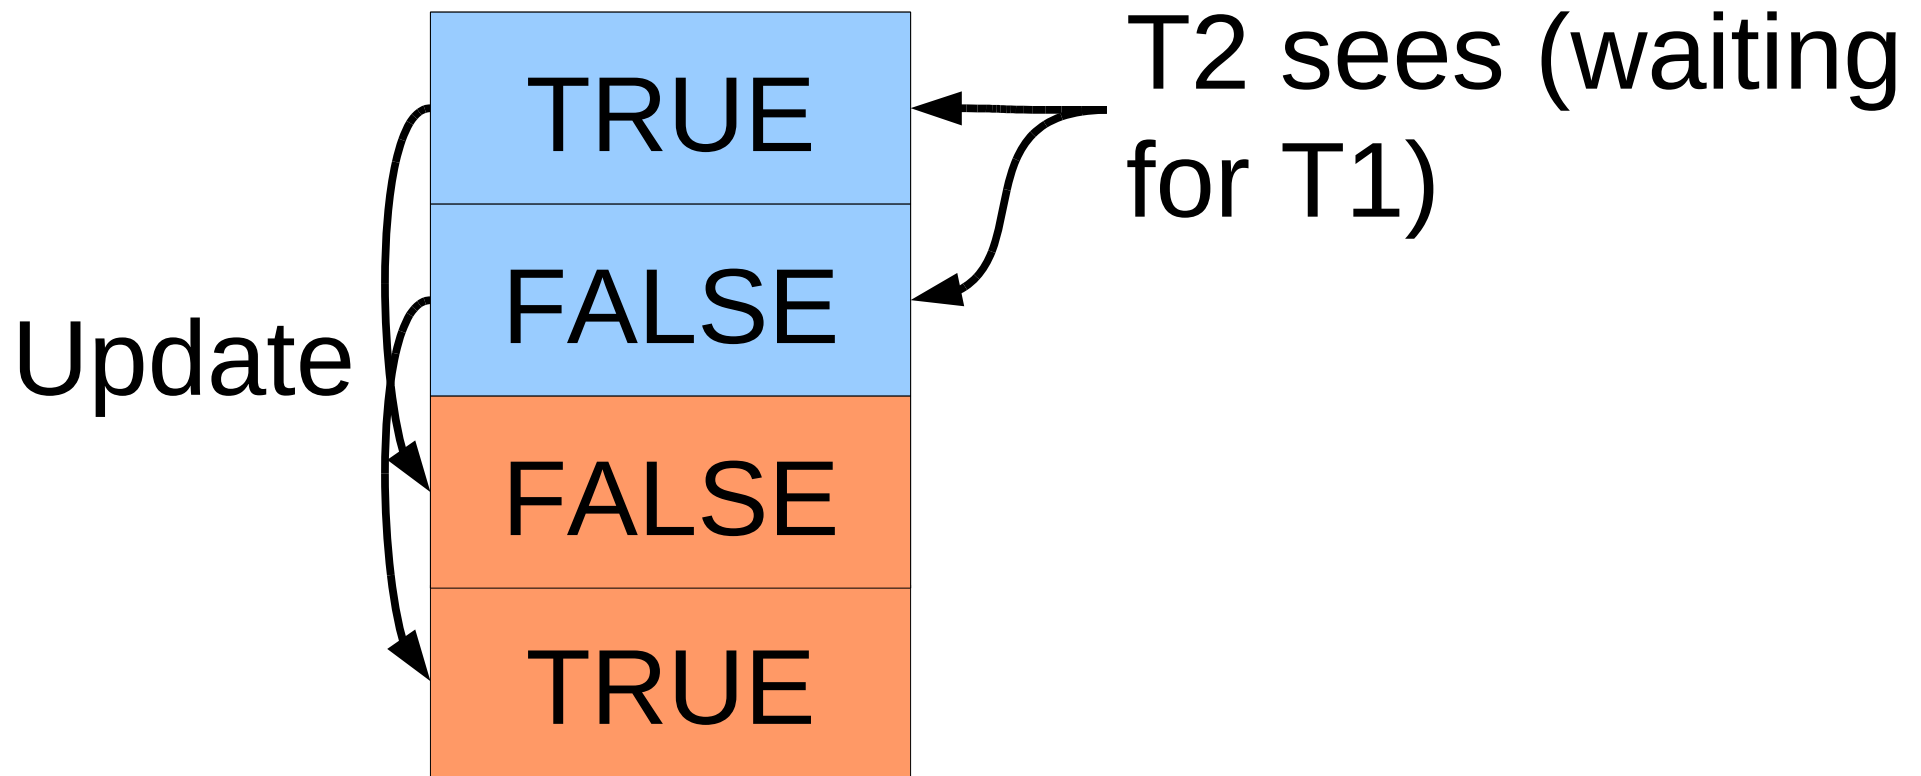

# Snapshots Pitfall

•Transaction 1:  
BEGIN;  
UPDATE foo SET  
    b = NOT b;  
  
COMMIT;

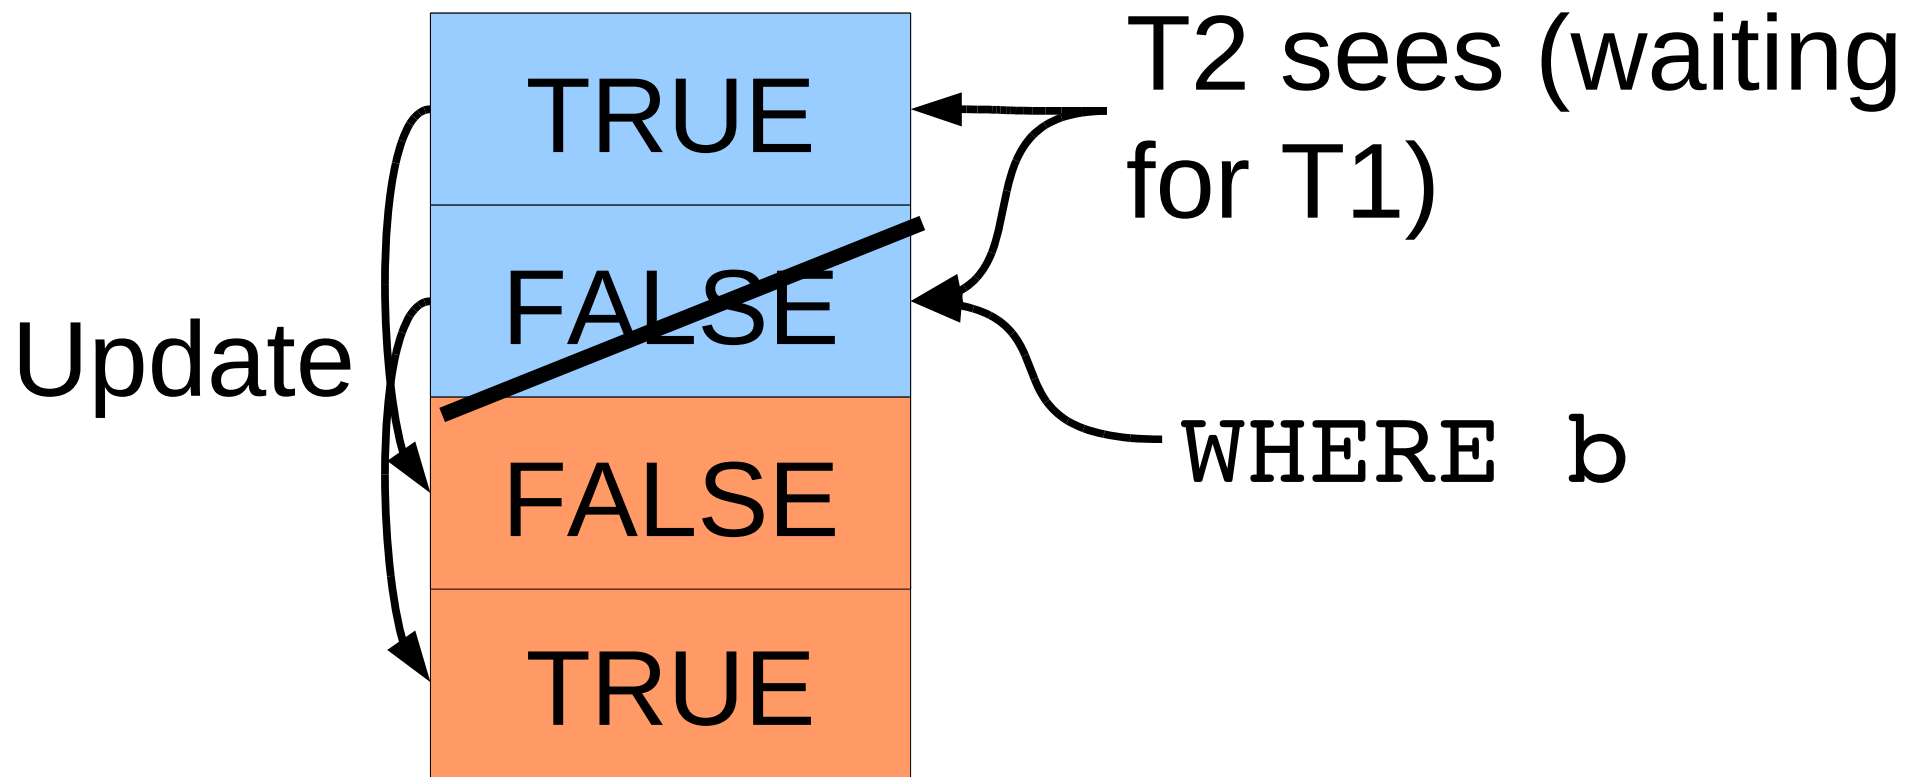

•Transaction 2:  
  
SELECT \* FROM  
    foo WHERE b  
    FOR SHARE;

Returns Nothing!

# Snapshots Pitfall (cont.)

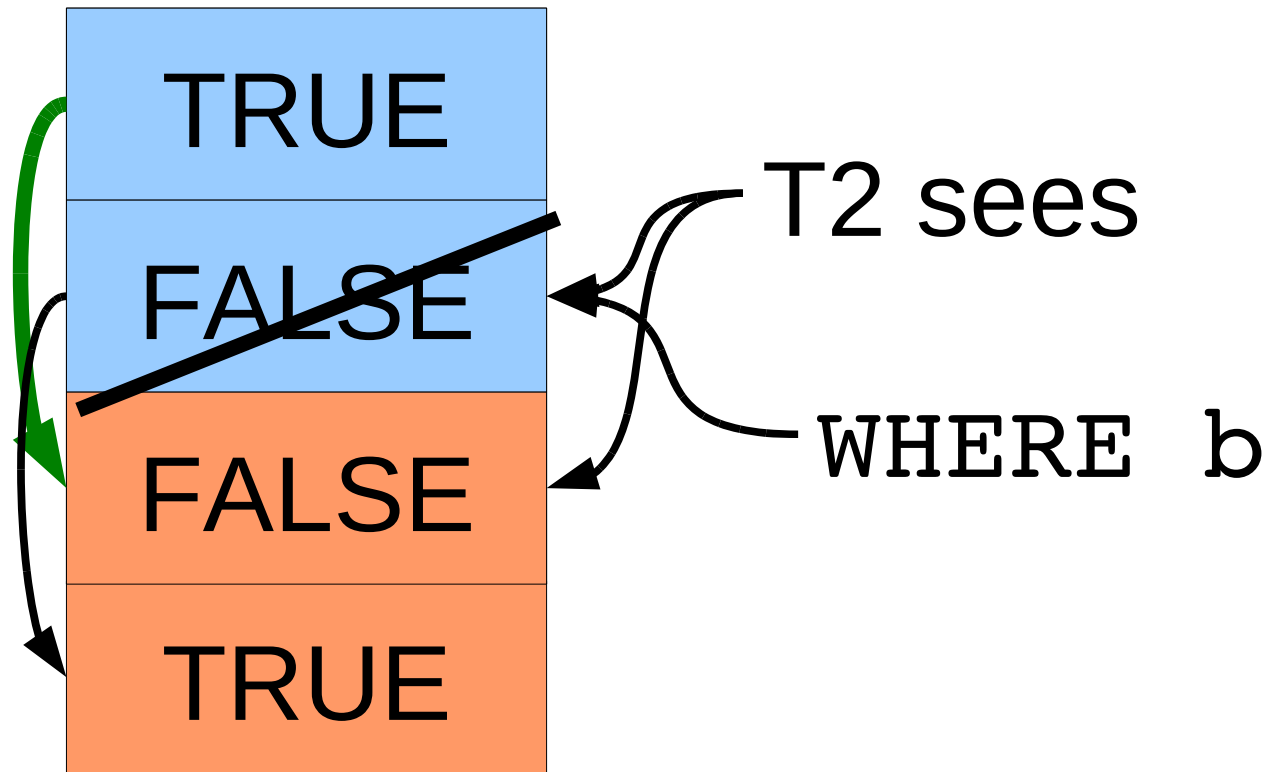

# Snapshots Pitfall (cont.)

# Snapshots Pitfall (cont.)

After T1  
commit,  
follow  
update  
chain.

# Snapshots Pitfall (cont.)

# Good News!

Deferrable UNIQUE check patch  
submitted by Dean Rasheed

- July Commitfest
- [commitfest.postgresql.org](http://commitfest.postgresql.org)

# Conclusion

- PostgreSQL isn't perfect
- SQL isn't perfect
- Even if they were, these complex behaviors are tricky
  - E.g. Interval math
- Where improvements can be made, solutions are appearing very quickly
